

Representation Theory through Parking Functions

Alexander Wilson
York University

1. Parking Functions

Parking Functions

- a) Each car has a spot it prefers, and $\# \text{cars} = \# \text{spots}$
- b) A car first drives to that preferred spot, taking it if it's open
- c) If it can't park there, it keeps driving until the first available spot.

If every car parks, the tuple of preferences is a Parking function
(e.g. (2, 1, 2))

Write PF_n for the set of parking functions of n .

$(2, 3, 2)$ is not a parking function

Which are parking functions?

Failing to Park

- A preference tuple fails to park when too many cars prefer spots too far along. That is,

$$\alpha = (\alpha_1, \alpha_2, \dots, \alpha_n) \in PF_n$$

exactly when

$$\underbrace{\#\{i \mid \alpha_i > k\}}_{\substack{\text{\# Cars wanting} \\ \text{to park past spot } k}} \leq \underbrace{n - k}_{\substack{\text{\# spots available} \\ \text{Past spot } k}} \quad \text{for all } k = 1, 2, \dots, n-1$$

★ This has nothing to do with how the tuple is ordered!

Sorting Parking Functions

The observation above means rearranging the preference tuple won't change whether it is a parking function.

Ex) PF_3

111					
112	121	211			
113	131	311			
122	212	221			
123	132	213	231	312	321

} PF_n breaks up into
Pieces based on
which tuples rearrange
to each other

Comparing Pieces

Ex) PF,

⋮

1111234 1112134 ...

1112233 1112323 ...

⋮

These two pieces both
have 210 elements,
but do they have
the same Structure?

This question will motivate the rest of what we do today.

Symmetric group

- S_n consists of all permutations (rearrangements) of the numbers $1, 2, \dots, n$.
- we'll draw these permutations like this:

$$\sigma = \begin{array}{cccccc} 1 & 2 & 3 & 4 & 5 & 6 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cancel{\cdot} & \cdot & \cancel{\cdot} & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ 3 & 1 & 2 & 5 & 4 & 6 \end{array}$$

Ex] The six elements of S_3 are:

$$\begin{array}{ccc} \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \end{array} \quad \begin{array}{ccc} \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \end{array} \quad \begin{array}{ccc} \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \end{array}$$

Symmetric group

- S_n consists of all permutations (rearrangements) of the numbers $1, 2, \dots, n$.
- we'll draw these permutations like this:

$$\sigma = \begin{array}{cccccc} 1 & 2 & 3 & 4 & 5 & 6 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ \cancel{\cdot} & \cancel{\cdot} & \cdot & \cancel{\cdot} & \cdot & \cdot \\ 3 & 1 & 2 & 5 & 4 & 6 \end{array}$$

Ex] The six elements of S_3 are:

$$\begin{array}{c} | \\ \cdot \\ | \end{array} \quad \begin{array}{c} \times \\ \cdot \\ | \end{array} \quad \begin{array}{c} | \\ \cdot \\ \times \end{array}$$

$$\begin{array}{c} \times \\ \cdot \\ \times \end{array} \quad \begin{array}{c} \times \\ \cdot \\ \times \end{array} \quad \begin{array}{c} \cdot \\ \times \\ \times \end{array}$$

Action on Parking Functions

Given a parking function $\alpha \in \text{PF}_n$ and a permutation $\sigma \in S_n$,

We have σ "act on" α as follows:

$$\alpha = (1, 2, 1, 3, 3, 1)$$

$$\sigma \cdot \alpha = (2, 1, 3, 3, 1, 1)$$

The orbit of α under the S_n -action is

$$S_n \cdot \alpha = \{\sigma \cdot \alpha \mid \sigma \in S_n\}$$

Orbits of Parking Functions

Ex] PF_3

	1 1 1	1 1 X	X 1 1	1 X 1	1 1 X	X X 1
1 1 1	1 1 1	1 1 1	1 1 1	1 1 1	1 1 1	1 1 1
1 1 2	1 1 2	1 2 1	1 1 2	1 2 1	2 1 1	2 1 1
1 1 3	1 1 3	1 3 1	1 1 3	1 3 1	3 1 1	3 1 1
1 2 2	1 2 2	1 2 2	2 1 2	2 2 1	2 1 2	2 2 1
1 2 3	1 2 3	1 3 2	2 1 3	2 3 1	3 1 2	3 2 1

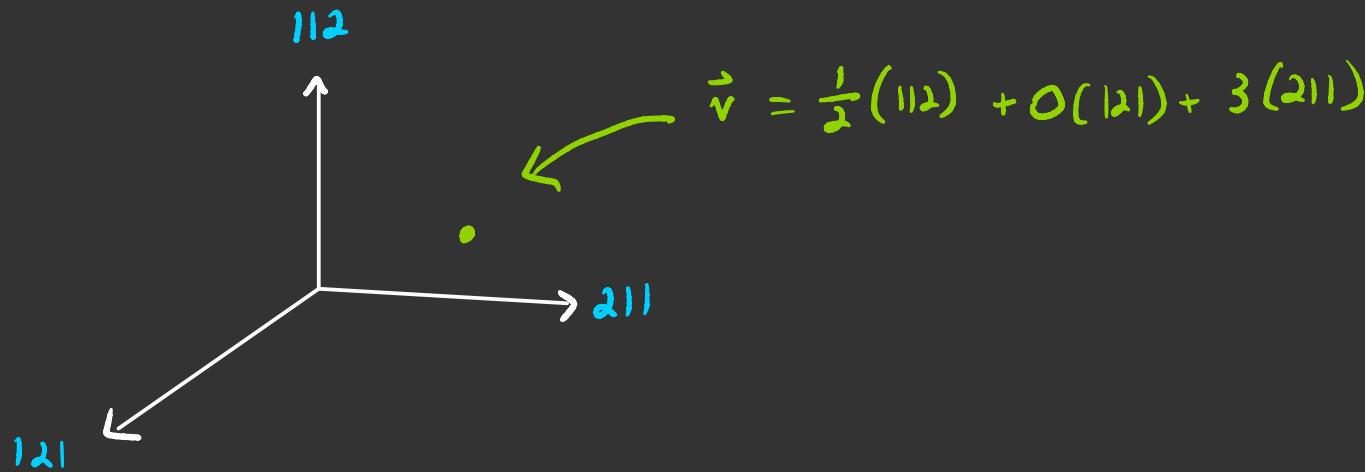

The way we
split up PF_3
earlier is
into S_3 -orbits!

A Further Decomposition

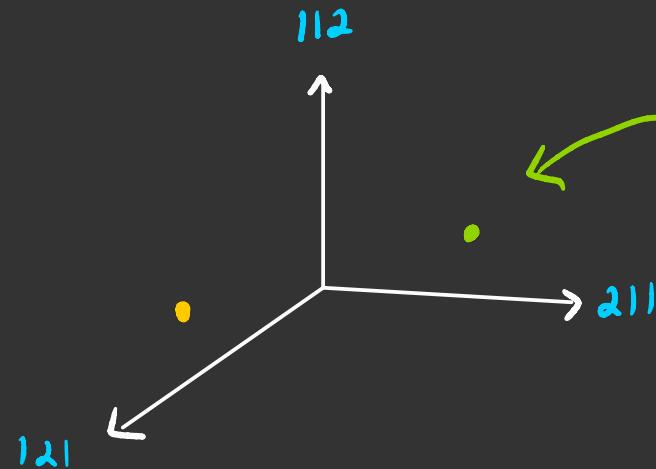

Let's zoom in on one of these orbits:

$$S_3. \text{112} = \{ \text{112}, \text{121}, \text{211} \}$$

We're going to imagine a 3-dimensional space with a coordinate for each parking function in this orbit.

A Further Decomposition

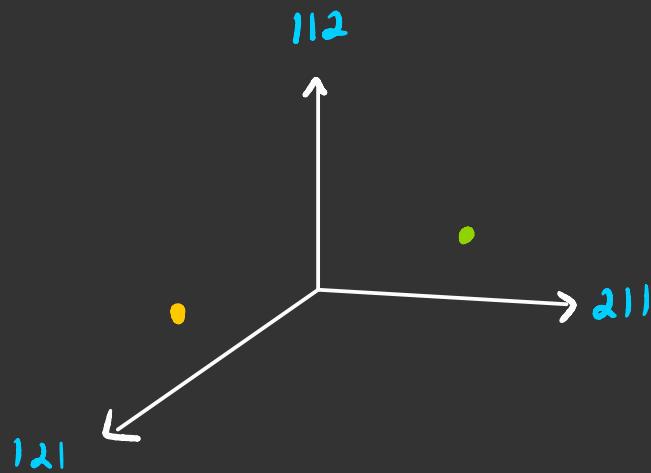

$$\vec{v} = \frac{1}{2}(112) + 0(211) + 3(121)$$

$$\left(\frac{1}{2}, 0, 3\right)$$

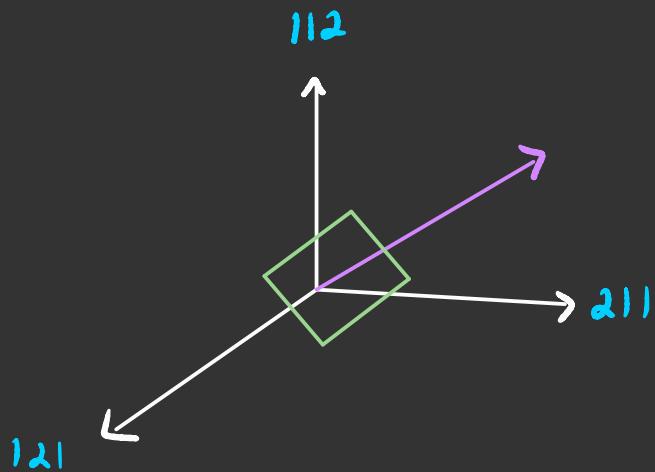

$$\sigma = \begin{array}{c} \times \\ \bullet \end{array} \quad \left| \begin{array}{l} \sigma \cdot 112 = 112 \\ \sigma \cdot 121 = 211 \\ \sigma \cdot 211 = 121 \end{array} \right| \quad \left| \begin{array}{l} \sigma \cdot \vec{v} = \frac{1}{2}(112) + 0(211) + 3(121) \\ \downarrow \\ \left(\frac{1}{2}, 0, 3\right) \end{array} \right.$$

A Further Decomposition

This space is an example of a representation of S_3 .

A Further Decomposition

$$V = \{a(112) + b(211) + c(121) \mid a, b, c \in \mathbb{R}\}$$

$$W = \{a(112) + b(211) + c(121) \mid a+b+c=0\}$$

These subspaces are S_n -invariant:

For any $\vec{v} \in V$, $\sigma \cdot \vec{v} \in V$.

we say that this representation decomposes as

$$V \oplus W$$

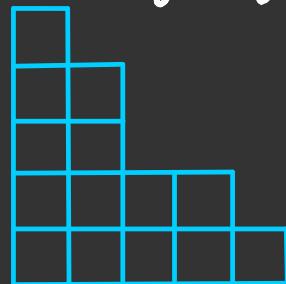

2. Representations of S_n

Tableaux

A Partition of a positive integer n is a weakly-decreasing sequence λ adding to n

$$(5, 4, 2, 2, 1) \vdash 14$$

The diagram of λ is a left-aligned array of boxes with row-lengths given by λ .

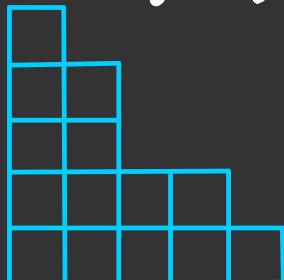

Tableaux

A Partition of a positive integer n is a weakly-decreasing sequence λ adding to n

$$(5, 4, 2, 2, 1) \vdash 14$$

The diagram of λ is a left-aligned array of boxes with row-lengths given by λ .

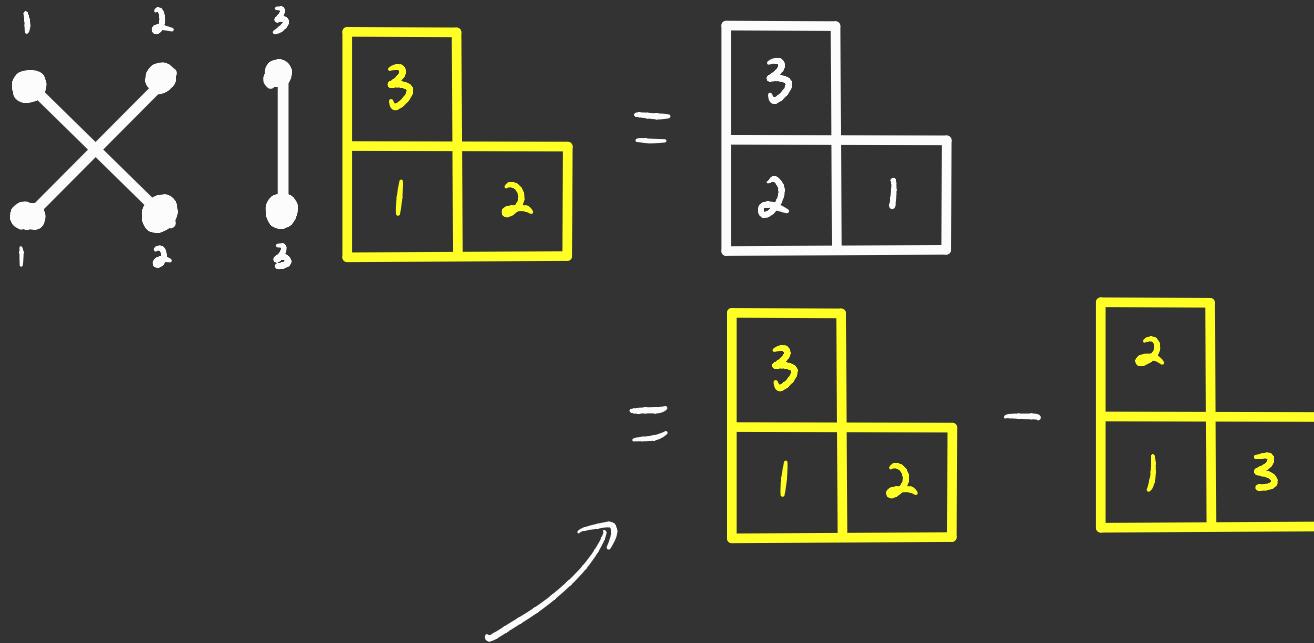

A (standard Young) tableau of shape λ is a filling of its diagram with the numbers $1, \dots, n$ so that

- i) Rows increase left-to-right
- ii) Columns increase bottom-to-top.

8				
7	12			
6	10			
3	5	13	14	
1	2	4	9	11

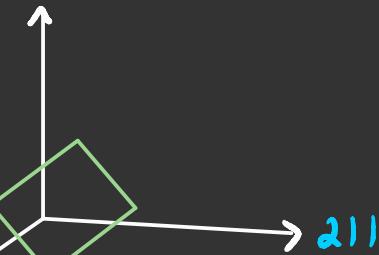

11				
8	14			
10	6			
3	4	12	13	
2	1	7	5	9

Acting on Tableaux

"straightening"
algorithm

112

121

2	
1	3

$$\longleftrightarrow (211) - (121) \in W$$

3	
1	2

$$\longleftrightarrow (211) - (112) \in W$$

$$W = \{a(112) + b(211) + c(121) \mid a+b+c=0\}$$

is the same as acting
on shape $\begin{smallmatrix} & 1 \\ 2 & 1 \end{smallmatrix}$ tableaux

1	2
3	

$$= \begin{smallmatrix} & 1 \\ 2 & 1 \end{smallmatrix} - (211) - (112)$$

$$= (121) - (112)$$

$$= (211) - (112) - ((211) - (121))$$

3	
1	2

$$= \begin{smallmatrix} & 1 \\ 2 & 1 \end{smallmatrix} - \begin{smallmatrix} & 1 \\ 1 & 3 \end{smallmatrix}$$

Irreducible Representations

- Write S^λ for the representation of S_n obtained from the action of S_n on tableaux of shape λ .
- Every representation of S_n decomposes into pieces that look like S^λ for λ a partition of n .

Ex] PF_3

$$\begin{array}{ccccccc} & & & & & & \\ \hline & 1 & 1 & 1 & & & \\ \hline & 1 & 1 & 2 & 1 & 2 & 1 & 1 \\ \hline & 1 & 1 & 3 & 1 & 3 & 1 & 1 \\ \hline & 1 & 2 & 2 & 2 & 1 & 2 & 2 \\ \hline & 1 & 2 & 3 & 1 & 3 & 2 & 2 \\ & & & & 2 & 1 & 3 & \\ & & & & 2 & 3 & 1 & \\ & & & & 3 & 1 & 2 & \\ & & & & 3 & 2 & 1 & \end{array} \quad \left\{ \begin{array}{l} \cong S^{(3)} \\ \cong S^{(3)} \oplus S^{(2,1)} \\ \cong S^{(3)} \oplus S^{(2,1)} \oplus S^{(2,1)} \oplus S^{(1,1,1)} \end{array} \right.$$

Comparing Pieces

Ex) PF_7

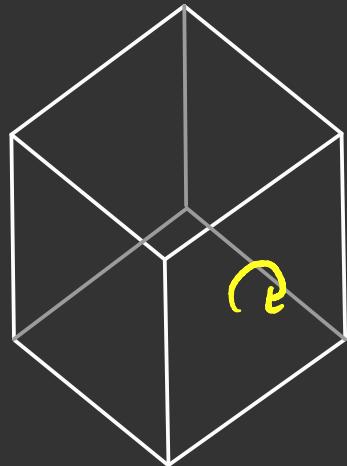

#times S^λ appears in...

λ	1 1 1 1 2 3 4 ...	1 1 1 2 2 3 3 ...
(3, 2, 2)	0	1
(3, 3, 1)	0	1
(4, 1, 1, 1)	1	0
(4, 2, 1)	2	2
(4, 3)	1	2
(5, 1, 1)	3	1
(5, 2)	3	3
(7)	1	1

3. Representation Theory

- Representation theory is about symmetry

Ex] Geometric objects

Ex] Combinatorial objects

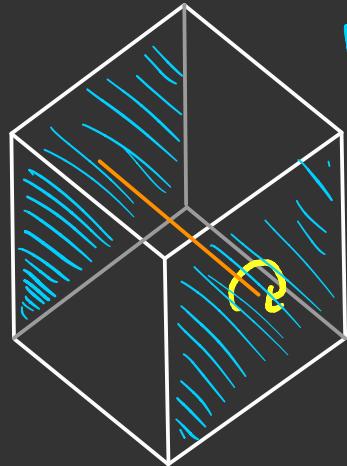

1 1 2 1 3 3

~~2~~
~~3~~

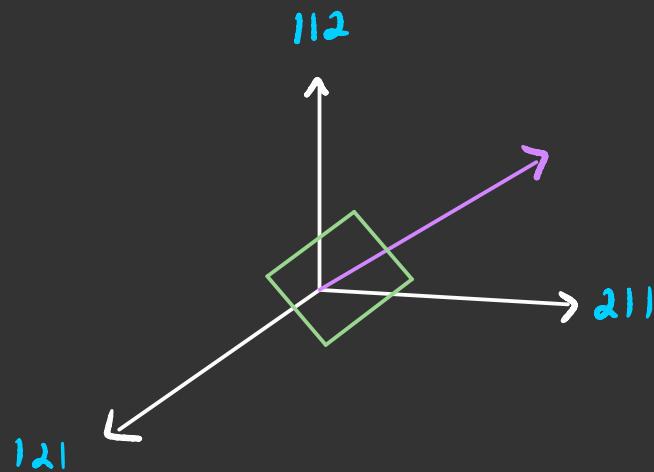

1 1 3 2 1 3

- We like to break symmetries down into smaller pieces
